Plugging in to the Lightning Network

What is the Lightning Network?
How can I use the lightning network?
How does the lightning network function?
Where is the Lightning Network headed?

DISCLAIMER

⚡ High level functional overview, not technical.

⚡ DO YOUR OWN RESEARCH.

DON'T TRUST, VERIFY.

Lightning is still #RECKLESS (but it's getting better).

Lightning is changing rapidly, and all of this may change.

What is the Lightning Network?

- A possible scaling solution
- Increased divisibility
- A rapid settlement solution
- A privacy improvement
- A smart contract layer for Bitcoin

How can I use the Lightning Network?

1. Custodial Lightning Wallets (most user friendly)
2. Non-custodial mobile Wallets (user friendly)
3. Full Control Lightning Wallets – Routing Nodes
 - Non-Custodial
 - Channel Management
4. Lightning Backend

Custodial Lightning Wallets

- Custodial = Not Your Keys, Not Your Coin.
 - DO NOT STORE LARGE AMOUNTS!
- Extremely User Friendly
- Blue Wallet
- LNtxbot in Telegram
- **Wallet of Satoshi**

Non-Custodial Mobile Wallets

- User Friendly
- No Channel Management
- Single balance – BTC/LN (Muun)
- Muun Wallet
- Phoenix Wallet
- Breez Wallet

Routing Nodes

- Channel Management
- Non-custodial
- Can participate in Liquidity Marketplaces

- Raspiblitz
- Raspibolt
- NODL
- Umbrel

RASPI ⚡ **BLITZ**

How does LN function?

1.Channels

2.Routing

How does LN function?

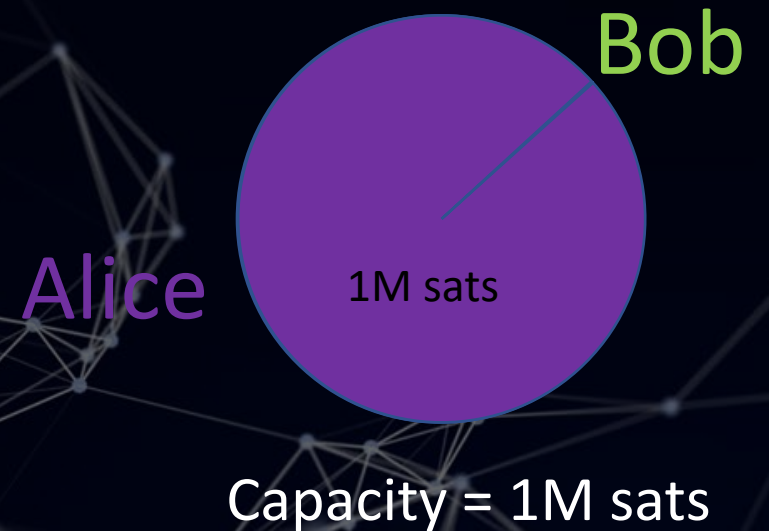

- Agreements are made between users called “Channels”
 - Channels are formed in an on-chain transaction
 - Channels are closed in an on-chain transaction
 - Unlimited transactions can occur between open and close outside the blockchain

Channels

Alice opens a channel with Bob.

Alice pays 1M sats to a wallet that Alice and Bob control.

(2 of 2 multisig)

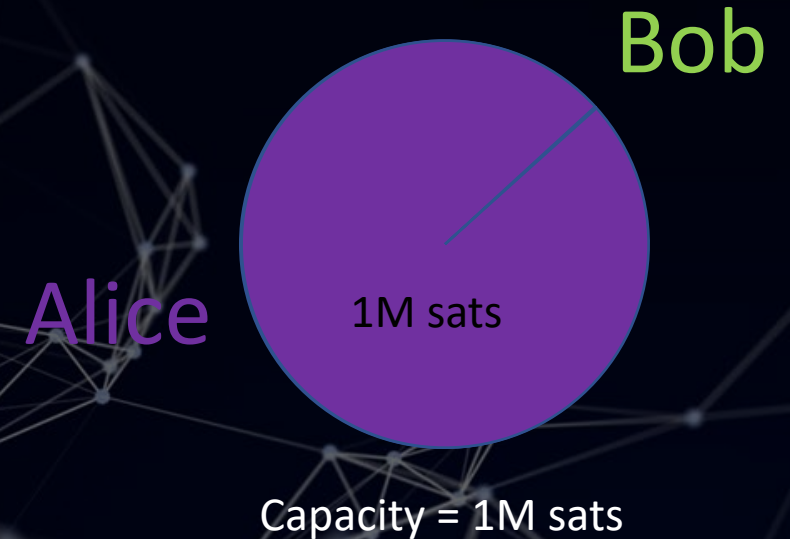

Channels

Alice and Bob both sign a payout:

Alice gets 1M sats

Bob gets 0 sats

Can be broadcast at any time (force close)

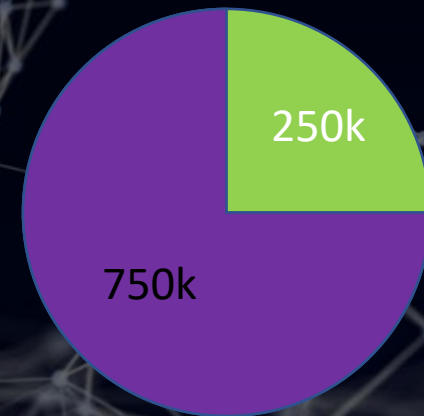

Channels

⚡ Lightning payments are updates of the payout.

Alice pays Bob 250k sats.

Alice

Bob

Local + Remote Balance = Channel Capacity

*ignoring the *commit* which reserves some balance to pay a next block force close

Capacity = 1M sats

Channels

⚡ Q: What is the maximum lightning payment that **Bob** can pay to **Alice**?

Channels

⚡ Q: What is the maximum lightning payment that **Bob** can pay to **Alice**?

⚡ Answer: 250k sats

Alice

Capacity = 1M sats

Channels

- Alice and Bob's nodes must be online to send/receive.
- Payout updates in a channel cost zero fees.
- **WARNING:** Offline nodes may be stolen from by publishing old channel states (learn about *Watchtowers* to penalize).

Channels

- Alice and Bob's nodes must be online to send/receive.
- Payout updates in a channel cost zero fees.
- **WARNING:** Offline nodes may be stolen from by publishing old channel states (learn about *Watchtowers* to penalize).

Any questions before Routing? →

Routing

- Payments can “hop” between channels
- Routing Nodes can charge fees for the use of their channels

Routing

- ⚡ **Bob** has another 1M sat channel open with **Carol**.
- ⚡ **Alice** can pay **Carol** via **Bob's** channel.
- Bob** can charge a ⚡ routing fee for this service.

Routing

Routing

Alice pays Carol 250k sats and a ⚡ fee to Bob

Routing

Alice pays Carol 250k sats and a ⚡ fee to Bob

Routing

Bob charges Alice ⚡ based on the hop to Carol

The fee rate on Bob's channel to Carol is the cost.

Routing

Q: What is the maximum* that Alice can pay Carol?
*(ignore fees)

Alice

500k

500k

Bob

250k

750k

Carol

Routing

Q: What is the maximum* that Alice can pay Carol?
*(ignore fees)

Alice

500k

500k

Bob

250k

750k

Carol

A: Carol's inbound liquidity from Bob is limiting.
A maximum of 250k sats can be paid.

Routing

Alice

500k

500k

Bob

250k

750k

Carol

Alice can't see the balance of Bob's channel to Carol.

Alice will experience a payment failure for payments larger than 250k.

Routing

Additional Notes:

- Fees are public (see 1ml.com)
- Flat fee and a ppm fee rate (sometimes msat/sat)
 - 1 sat + 100 ppm payment, for example
- May be changed at any time

Routing

- Routing Nodes are getting passive bitcoin income
 - Must maintain inbound & outbound capacity to route
\$\$\$\$\$
- Routing Nodes don't know the ultimate origin/destination
 - TOR routed, they only know adjacent channel details
- Incentives are for *high uptime*, *long-lasting* channels.

Routing

- Routing Nodes are getting passive bitcoin income
 - Must maintain inbound & outbound capacity to route
\$\$\$\$\$
- Routing Nodes don't know the ultimate origin/destination
 - TOR routed, they only know adjacent channel details
- Incentives are for *high uptime*, *long-lasting* channels.

Where is the
Lightning Network
headed?

Liquidity Marketplaces

- Inbound Liquidity is a valuable commodity
 - Inbound = The sats that others have pointed to your node
- Buy Inbound
 - Lightning Pool (blind auction, command line)
 - Lightning Liquidity Bot (on Telegram)
- Sell Inbound
 - Lightning Loop

Strike

- Zero fee transactions
- Basically Venmo, but lightning compatible
- International Settlement Layer
 1. Remittances
 2. High Frequency Trading (?)

Thank You!
